

# Containers & Kubernetes

Session #01

Containers: Introduction

Images: Introduction

Registry: Introduction

Container Lifecycle

Linux vs Windows Containers

Lab

# Containers: Introduction

# What is a container?

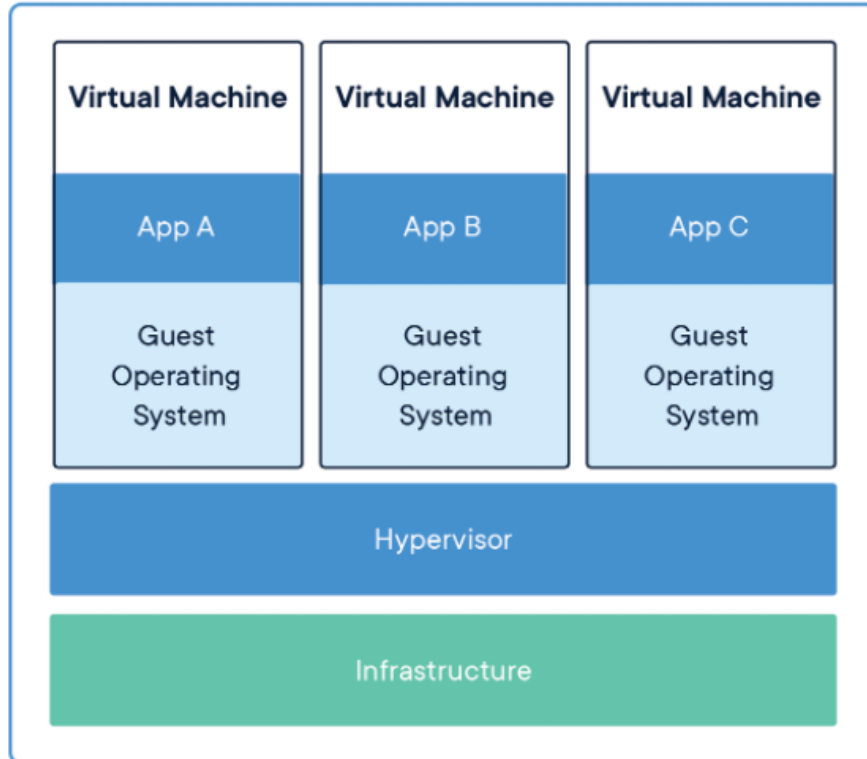

## Containers: Introduction

- A method of operation system virtualization
- A way to wrap an application into its own isolated box
- Includes only the binaries needed to support the application
- Isolates an app with its own view of the host from the perspectives of memory, CPU and network

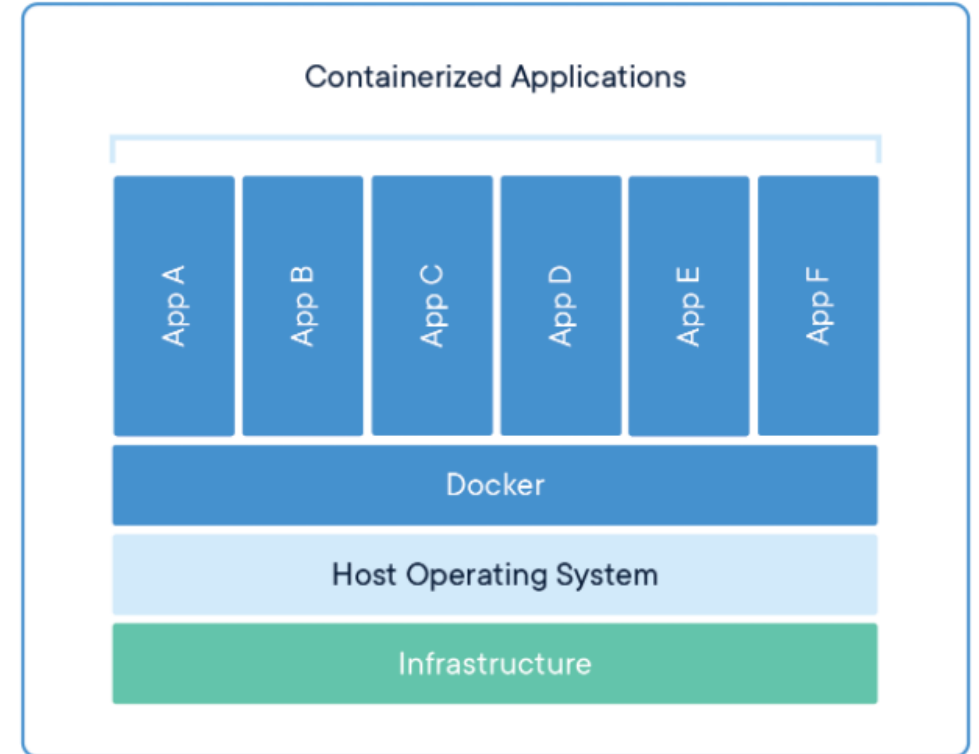

# VM vs Containers

## Containers: Introduction

### Virtual machines

Virtualize the hardware  
VMs as units of scaling

### Containers

Virtualize the operating system  
Applications as units of scaling

# Benefits of using containers

## Containers: Introduction

# Benefits of using containers

## Containers: Introduction

- **Agility:** Ship apps faster
- **Portability:** Easily move workloads
- **Density:** Achieve resource efficiency
- **Rapid scale:** Scale easily to meet demand

# Images: Introduction

# What is a container image?

## Images: Introduction

- Analogous to a VHD + Config for Virtual Machines
- Read-only templates for containers
- Can depend on other images
- Built up from a series of layers

# What is a container image?

## Images: Introduction

- Each container has its own writable container layer
- All changes are stored in this container layer
- Multiple containers can share access to the same underlying image but have their own data state

# How Image and Container relates?

## Images: Introduction

- Image is a template for the container
- Container is a running instance of the workload
- Making OOP comparison
  - Image is a class
  - Container is an instance of the class (i.e. an object)
- Using one Image you can instantiate several containers

# Registry: Introduction

# What is a Registry?

## Registry: Introduction

- Registry is a stateless, highly scalable server side application that stores and lets you distribute images

# How to use a Registry?

## Registry: Introduction

- Tightly control where your images are being stored
- Fully own your images distribution pipeline
- Integrate image storage and distribution tightly into your in-house development workflow
- Public registry and/or Private registry

# Public vs Private

## Registry: Introduction

- Docker Hub and Docker Store
  - Public, official and private image repositories
  - Granular access controls with organization support
  - Automated image build support
- Azure Container Registry (ACR)
  - Store and manage container images across Azure deployments
  - Maintain Windows and Linux container images
  - Same API and Tools as Docker Hub/Store/Registry
  - Supports hosting private registry with fine grain Role Based Access Control for management
  - Can be geo-redundant making it faster to download/upload images based on client location

# Docker: Container Lifecycle

# What is Docker?

## Docker: Container Lifecycle

Open-source software to build and manage containers.

Docker separates the application from the infrastructure using container technology

“Dockerized” apps can run anywhere on anything

No more dependency daemons so developers and system admins unite

# What is Docker?

## Docker: Container Lifecycle

# Docker concepts

## Docker: Container Lifecycle

### Client

Where Docker commands are executed

### Daemon

The background service running on the host that manages building, running and distributing Docker containers

### Image

An ordered collection of filesystems (layers) to be used when instantiating a container (more on it later)

### Container

A runtime instance of an image

### Registry

A service that provides access to repositories, either through Docker Hub or Azure Container Registry

# Docker: Container Lifecycle

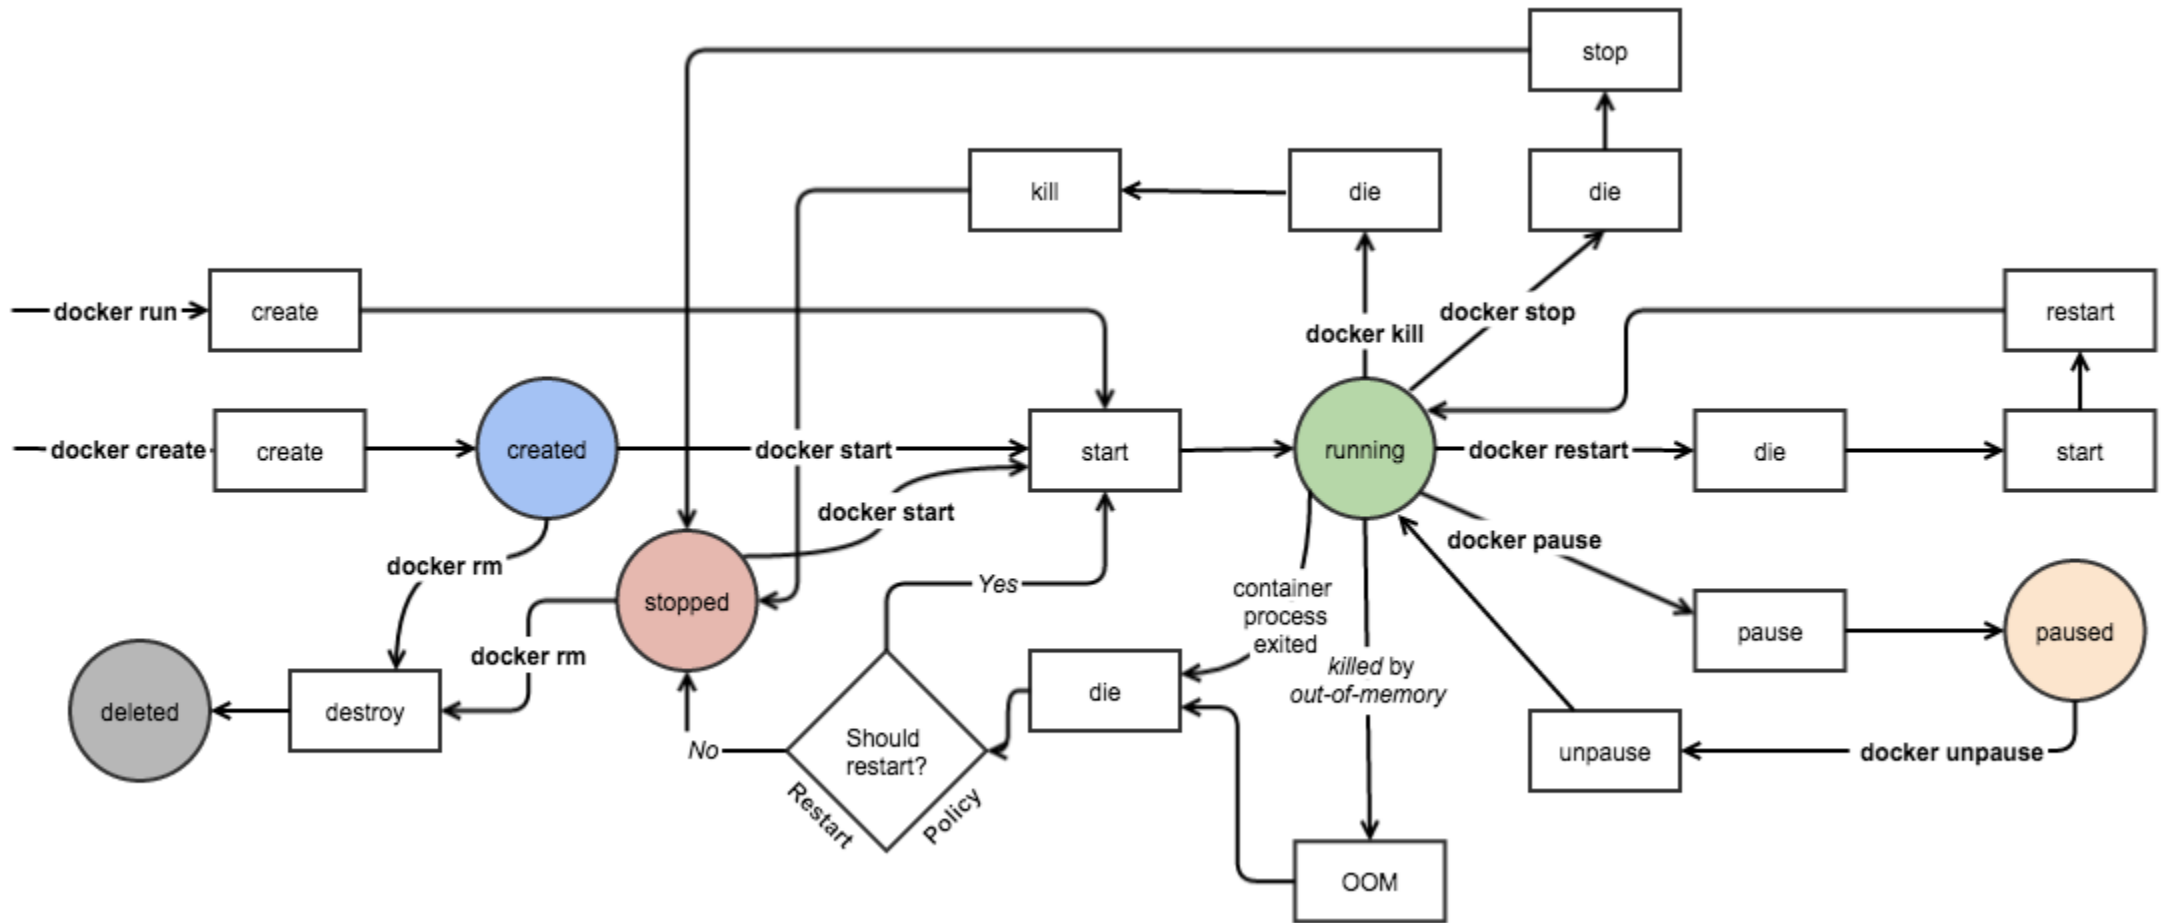

## Docker: Container Lifecycle

Container lifecycle ~ VM lifecycle

# Docker: Container Lifecycle

## Docker: Container Lifecycle

# Docker: Container Lifecycle

## Docker: Container Lifecycle

# Docker commands

## Docker: Container Lifecycle

`docker run` -> Runs a command in new container

`docker start` -> Start one or more stopped containers

`docker stop` -> Stop one or more running containers

`docker images` -> List images

`docker ps` -> List Docker containers.

`docker rm` -> Remove one or more containers

`docker rmi` -> Remove one or more images

`docker pull` -> Pull an image or a repository from a registry

`docker push` -> Push an image or a repository to a registry

`docker search` -> Search the Docker Hub for images

| Demo: Container Lifecycle

# Linux vs Windows Containers

# Linux Containers

## Linux vs. Windows Containers

- Containers started to be available only on Linux hosts with Linux Containers
- Now you may use Docker Desktop to manage and handle containers on Windows Host
- Windows Host can run Linux Containers using VMs or (better approach) WSL 2
- Windows Subsystem for Linux 2 allow you to run Linux inside Windows

# Windows Containers

## Linux vs. Windows Containers

- For running Windows Containers you need to have docker running on Windows Host
- Docker Desktop is a standard solution for developer machine (now with licensing...)
- For production environments you need to enable Containers feature on Windows Server (native on 2019 and 2022)
- Windows Container version needs to be equal or less than Windows Host Machine Kernel

# Windows Containers

## Linux vs. Windows Containers

**Windows** ([https://hub.docker.com/\\_/microsoft-windows](https://hub.docker.com/_/microsoft-windows)) \*New in Windows Server 2019

- Automation workloads

- Carries most Windows OSS components

**Windows Server Core** ([https://hub.docker.com/\\_/microsoft-windows-servercore](https://hub.docker.com/_/microsoft-windows-servercore))

- Minimal installation of Windows Server 2016

- Contains only core OS features

- Command-line access only

**Nano Server** ([https://hub.docker.com/\\_/microsoft-windows-nanoserver](https://hub.docker.com/_/microsoft-windows-nanoserver))

- Available only as container base OS image (no VM support)

- 20 times smaller than Server Core

- Headless – no logon or GUI

- Optimized for .NET Core applications
